Mil-Std-1772  
Certified & Qualified

# Mil-Std-1553/MacAir Products

## NHI-1513 Series

### Voltage Driver Single Transceivers

#### FEATURES:

- 1.5 Watt Total Hybrid Dissipation at 25% Transmitting Duty Cycle.
- Meets MIL-STD-1553A/B and MACAIR.
- TTL Compatible.
- Screened to MIL-STD-883.
- Thick Film Hybrid Technology.
- Integrated Receiver and Driver.
- Plug-in or Flat Pack Configuration.
- Receiver Filtering Enhances S/N Ratio.
- Improved Receiver and Transmitter Filtering.

#### GENERAL DESCRIPTION:

These National Hybrid Data Bus Transceivers contain differential voltage source drivers and differential receivers. They are intended for applications using a MIL-STD-1553A/B data bus or a MACAIR data configured data bus.

The NHI-1513 transceiver is specifically designed to comply with the requirements of the following MACAIR specifications: A-3818, A-5232, A-5690, and A-4905. The transmitter section of this unit contains a specially designed filter which suppresses the higher order components of the transmission in accordance with the MACAIR specifications and producing sinusoidal output waveform. This filter also complies with the group delay requirements of the MACAIR document.

The NHI-1514 transceiver produces a trapezoidal waveform during transmission.

The NHI-1515 transceiver is identical to the NHI-1513 unit but it incorporates a voltage control pin which allows the transmitter output level to be adjusted from 0 volts to maximum level as the control voltage is varied from 0 to +10 volts.

The NHI-1516 and NHI-1517 are separate receivers and transmitters respectively. The Transmitter produces a trapezoidal output wave form for MIL-STD 1553A/B applications.

#### TRANSMITTER

The transmitter section of these devices is driven by complementary TTL signals into the TX DATA and TX DATA\* inputs. This produces a nominal 30 volt peak to peak signal across a 140 ohm load. The transmitter is coupled to the bus via a 1:1 transformer whose secondary is connected to two 52 ohm isolation resistors which feed the terminated 70 ohm bus. This will produce a nominal voltage on the bus of 7.5 volts peak to peak.

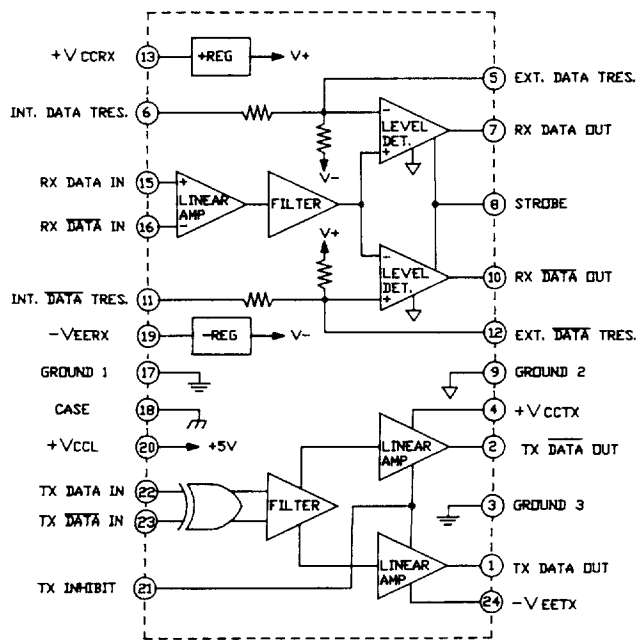

The transmitter is automatically inhibited and placed in the high impedance state when both TX DATA and TX DATA\* inputs are either at a logic "1" or a logic "0" simultaneously. A logic "1" applied to the TX INHIBIT input is used as a manual override and will disable the transmitter and place it in the high impedance state.

#### RECEIVER

The receiver is transformer coupled to the bus by a 1:1 transformer. Its differential input stage drives a filter and threshold comparator. TTL data is outputted at the RX DATA and RX DATA\* outputs. The positive and negative thresholds may be controlled by internally set resistors. This is accomplished by grounding pins 6 and 11. The thresholds may also be set externally by putting resistors from pins 5 and 12 to ground.

The receiver outputs can be inhibited and pulled high by putting a logic "0" on the strobe input.

Pinouts for NHI-1513/14/15

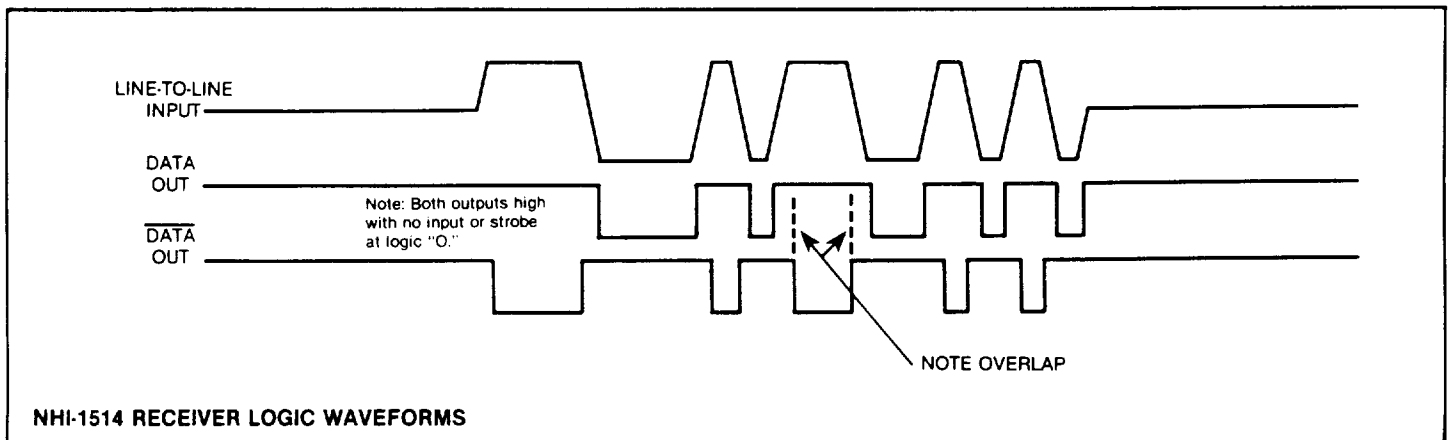

OPERATIONAL BLOCK DIAGRAM

NOTE: 1. Pin 14 is used on NHI-1515 to control the transmitter output amplitude.  
2. All grounds must be externally connected together.

# ELECTRICAL PARAMETERS, RECEIVER

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS

Output Characteristics Differential output level (140 ohm load) Differential Active output impedance at 1 MHz Rise and Fall times (10% to 90% of p-p output) (NHI-1514) Rise and Fall times (10% to 90%) (NHI-1513) Output offset at point A in Fig. 1 (35 ohm load) 2.5 $\mu S$ after mid bit crossing of the parity bit of the last word of a 660 $\mu S$ message Delay from 50% point of TX Data or TX $\overline{Data}$ input to zero crossing of differential output	$V_O$ $Z_{OA}$ $t_r$ $V_{OS}$ $t_{DTX}$ $t_{DTX}$	26 100 240	30 4 150 100 200	35 300 300 $\pm 75$	V p-p ohms nS nS mV peak nS nS
Amplitude Control Characteristics NHI-1515 only	$V_{CNTRL}$	0		+10	V

Note: DATA and DATA inputs must be complementary waveforms, with a 50% duty cycle and no gate delays between them.

**NHI-1514 TRANSMITTER LOGIC WAVEFORMS**

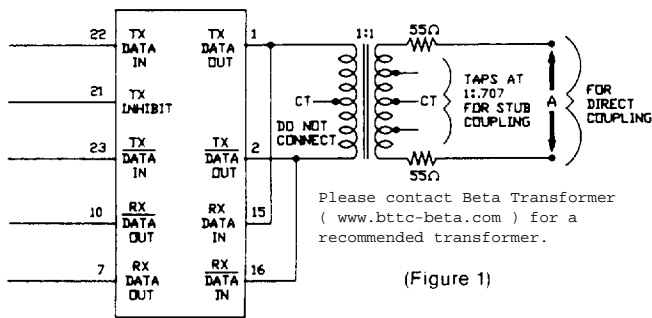

Note: DATA and DATA inputs must be complementary waveforms, with a 50% duty cycle and no gate delays between them.

# Voltage Driver Single Transceivers

## POWER AND THERMAL DATA, TOTAL HYBRID (DRIVER AND RECEIVER)

PARAMETER/CONDITION	SYMBOL	MIN	TYP	MAX	UNITS
Total Supply Current "Standby" mode, or transmitting at less than 1% duty cycle (e.g. 20µS of transmission every 2mS or longer interval)	I <sub>CCS</sub>		40	45	mA
	I <sub>EES</sub>		30	35	mA
	I <sub>CCL</sub>		12	15	mA
Total Supply Current transmitting at 1MHz into a 35 ohms load at point A in Figure 1 with 25% Duty Cycle..	I <sub>CC25</sub>		70	80	mA
	I <sub>EE25</sub>		60	70	mA
(I <sub>CCL</sub> limits do not change with mode of operation or duty cycle) 100% Duty Cycle	I <sub>CC100</sub>		150	165	mA
	I <sub>EE100</sub>		145	160	mA
Thermal Resistance, junction-to-case, of most critical device	θ <sub>JC</sub>			28	°C/W
Allowable transmitting duty cycle when case is held to + 125 °C maximum	± 12V supplies			100	%
	± 15V supplies			100	%

(Figure 1)

TYPICAL APPLICATION

1/4" x 1/4" 24 LEAD FLAT PACK

1/4" x 1/4" 24 PIN PLUG IN

MODEL	DESCRIPTION
1513	MACAIR TRANSCEIVER (SINUSOIDAL OUTPUT)
1514	MIL-STD-1553 A/B TRANSCEIVER (TRAPEZOIDAL OUTPUT)
1515	MACAIR TRANSCEIVER VARIABLE OUTPUT LEVEL CONTROLLED BY A DC VOLTAGE OF 0-10 VOLTS
1516	RECEIVER ONLY
1517	TRANSMITTER ONLY (TRAPEZOIDAL OUTPUT)
