## NHI-1501 Series

### +15V Dual Transceivers

#### Features/Applications:

- Very Low Standby Power
- Low Thermal Resistance
- Totally Isolated Channels
- Short Circuit Proof
- Superior Noise Performance
- Screened to Mil-PRF-38534

#### Description:

The NHI +15V dual transceivers are available in 1.900" x .780", 36 pin plug-in and flatpack packages.

Each receiver converts the 1553 bus bi-phase data to complementary RX and RX\_H TTL digital outputs for use by the manchester decoder. The device provides independent receiver enables for each channel. Devices are available with receiver outputs normally HIGH or LOW during standby mode for compatibility with industry standard decoders.

The transmitters will output bi-phase manchester to the coupling transformer when the TX and TX\_L inputs are driven by complementary TTL digital data. The device provides an independent transmitter inhibit TXINH for each channel.

## Transformer Requirements:

The NHI-1501 requires a transformer with a turns ratio of 1.40:1.00 for Direct Coupling, and a turns ratio of 2.00:1.00 for Transformer Coupling to the Mil-Std-1553 Bus. Please contact Beta Transformer ( [www.bttc-beta.com](http://www.bttc-beta.com) ) for a recommended transformer. The center tap on the transceiver side of the isolation transformer must be be grounded.

## Transmit Waveforms

## Transmitter Operation:

A high level input on TXINH will inhibit the transmitter outputs. If the TX & TX\_L transmitter inputs are both high or both low, the transmitter is also inhibited.

## Receive Waveforms

## Receiver Operation:

A low level input on RXENA will disable the receiver outputs RX & RX\_L regardless of bus activity.

The receiver output compatibility may be specified as logic 0 or logic 1 when in standby mode.
